Abstract
Partnership midwives and women is the philosophy of midwifery care in midwifery care pemeberian. Obstetric care often violent and respectful, especially during childbirth in developing countries. The aim is to explore the experiences of women and midwives, strategies and expectations of women and midwives in maternity care. This research method using electronic bibliographic databases. Search PubMed, Sciencdirect, Proquest carried out systematically from 2008 to 2018. The quality articles are selected based on the inclusion criteria and Critical Appraisal. Based on a review found the experiences of women and midwives to care in developing countries is not good because there is no accompanying childbirth, physical or verbal violence, and hospital facilities that do not support, whereas women experience midwives and midwives in developed countries, because of a critical period now, there is a sense of concern of midwives partner for women. Midwives and women have the expectation that midwifery services can be provided to the maximum, qualified and show mutual understanding and respect one another. Condition of midwifery care in developing countries need special attention. The importance of the midwife, ongoing care and partnering with women to suppress violence in maternity care.
The government needs to provide training to midwives about counseling skills, interpersonal relationship building and effective leadership in obstetric care. Midwives and women have the expectation that midwifery services can be provided to the maximum, qualified and show mutual understanding and respect one another.

**INTRODUCTION**

The philosophy of partnership is a relationship of trust, reciprocity, and equality between Midwives and women. Every midwife tried not to force the profession and personal strength in women. Instead, through negotiation, a midwife trying to build a relationship in the which every woman is the primary decision maker. Decision-making is a shared responsibility between women, families, and midwives. The practice of midwifery is done by placed women as a partner with a holistic understanding, as one experiences physical, psychological, emotional, social, cultural, spiritual and their reproduction (1–4). In 2015, the World Health Organization (WHO) declared the abolition of torture and the taste is not appreciated during the birth process with dialogue and advocacy of human rights (5). Results of the study (6) states that to improve services for all women and girls, everywhere, requiring Appropriate actions and prioritize quality health services, WHO in 2018, Provides Recommendations on the care intrapartum to experience nurturing positive where Respectful Maternal Care (RMC) Contribute to reducing the morbidity and mortality of women and reduce inequality service, maintaining the dignity, privacy and confidentiality, protected from persecution and fear / trauma and Allows selection of information and ongoing support for care (7). This is consistent with previous studies (6) emphasizes that mutual respect and violence is not the time of delivery is a global problem in some developing countries. Result studyfindings in South Africa and Ethiopia indicated resources to 21% of postpartum women reported not respected (8) harassed, and without consent (9) (17.7%), lack of privacy (15.2%), and 82% of occurrences appreciate at a health facility (10) in Ethiopia, lack of psychosocial support, are the decisive factor for deciding women give birth or not giving birth in a health facility (11,12). Several studies highlight the importance of quality during delivery (13–16). Showed that women experience and hear other people’s experiences, both valued and unappreciated during labor (17,18). Globally, the past 15 years, policy makers recommend maternity services centered on women, the Woman Centered Care (WCC). This care has been Adopted by England, Belgium (7) and Australia (19). This implementation approach proved beneficial where women have choices and positive care experience (20–22).

**MATERIALS AND METHODS**

Search Articles through a systematic search system (Systematic Literature Search) since the year 2008 to 2018, free full text, human species, and scholarly journals were identified by electronic database of PubMed, Proquest and ScienceDirect. The author uses Boolean (OR or AND) as a conjunction incorporate the keywords in the search, and more focused and relevant results in PubMed. This method is adapted to
the other database. Examples of search terms that are identified by means this is the childbirth experience, labor and birth or other variations, combined using Boolean AND with the word partnership, relationship or other variations. Articles are selected According to the inclusion and exclusion criteria (Tab.1). Analysis Critical Appraisal approach literature then performed the data extraction.

RESULTS AND DISCUSSION

Search Result

Initial literature search identified 856 articles (Fig. 1). After the removal of duplicates, 847 articles remained. With the title and abstract review, 730 were issued on the basis of irrelevant. Review of the full text of articles remaining 117 to be 102. The number of Articles in accordance with the criteria for inclusion are 15 articles, then performed a critical appraisal (23) issued 5 articles and the remaining 10 relevant articles.

Content Analysis

The findings of the systematic searches obtained articles published up to 2008, grouping the findings article consists of seven articles in the developed countries (Sweden, Germany, Ireland, Netherlands, Norway, and Western Australia) and 3 articles in developing countries (Africa, Ethiopia, Tanzania). All quality literature Q1 and using qualitative research methods. Participants in the relevant literature are midwives, obstetricians, midwifery students who were practicing in obstetrics ward and women receiving midwifery

Discussion

Women lack access midwifery care in developing countries. Related to this review, research has been conducted by Freedman et al (22); Freedman and Kruk (21), that women feel unappreciated, experience loneliness and are not supported, physical violence and speech and less given autonomy in decision making. Based on the results of Lambert et al research (24), organizational and structural challenges such as staff shortages, many cases were referred and poor referral pathways, supply shortages, hospital layout and structure (25–27) are often barriers that do not allow midwives to do what they know about good practice (15,19). Based
on the results of research by Burrows et al (28) and Bayes et al (19) the mistreatment of women during childbirth in the form of verbal abuse, rejection of assistance and lack of choice in the position of birth, and when midwives find women who do not comply. Therefore, they need for professional ethics training where ethics and patient rights are not evenly covered in the midwifery curriculum. Some steps may change to advance the process of humanizing births, including midwife education, institutional norms designed to support ongoing clinics during labour, the benefits of having a partner or family become active participants, and respecting women's desires when appropriate (29).

Women get good midwifery care in developed countries. Midwives make women feel comfortable when faced referrals, giving care is a good partner for postpartum women with a place to share experiences from pregnancy to delivery (1,2,8,30). Research in Australia conducted by Thelin et al (8) and Behruzi et al (25), that midwives can develop relationships that respect each other, trust and relationships between women and midwives. The presence of midwives for women becomes very important in providing continuity of obstetric care and calming influence. Studies conducted in Australia by Kuliukas et al (31) and Kennedy et al (6) that when women are referred in labour, women feel disappointment and anxiety about the condition of the fetus. The sensitivity of midwives to the cues associated with women in labor feel communication and remain calm and connected, to improve the relationship between the presence of women and midwives can increase awareness and trust in the experience of childbirth. Furthermore, from the research of Felix and Filippin (32) it is necessary to increase awareness and psychological adjustment for women to have and undergo confinement of safety support and guarantees for other women. Emotional experiences experienced by women and midwives (33) postpartum conditions require communication of their emotional expressions to prevent psychological stress. Women tend to trust midwives' expertise and advice when there is ongoing care (34).

There are differences in women's experiences in obstetric care in developing countries (10,16,24,27,28) and developed countries (1,17,31,34 – 37). Midwives in developing countries have similar care characteristics. In addition, women must confront the workers’ culture alone. Midwives in these three countries do not give women's autonomy rights in decision making. Speech or physical violence is common. Existing facilities in hospitals in three countries are inadequate. Midwives in developed countries give priority to women who care, respect, and become ‘friends’ sharing care experiences. Midwives in developed countries give priority to ongoing care in early pregnancy and the promotion of normal births to reduce the incidence of Sectio Caesarean (SC). The results of Mounier-Jack, Mathew and Mays (38) research on health care in developing countries have a narrower and less ambitious scope, while health services in developed countries have broader efforts to coordinate various services including those outside the system health care. Developing countries focus more on funding and efficient access to services, while in developed countries the quality of care, experience, and reducing dependence on hospital care is more expensive.

Women expect midwifery care to be sufficient information in midwifery care, assessment with normal classroom material, midwife competencies, hospital births, supported midwifery care, family / relative meetings, empowerment of health care centred on women (17,39). Women need to be provided with information about midwifery services, midwife competencies, licensed interventions and rights and choice of care, not only for individual consultations, but also through written agreements
or online platforms that are easily accessible, effective translation and communication and participation between midwives and backup doctors and ongoing care of female midwives obtained from early pregnancy to weaning (40). The results of a study conducted by Indah Muflihatin (41) at the Panti Community Health Center, Jember Regency said that the satisfaction in regarding, information received and waiting times and services for pregnant women as a whole is known to have strong associations with a willingness to come check again.

Midwives hope that midwifery care is an understanding of the professional profile of midwives, maximization in providing midwifery care and preventing interprofessional conflicts in care (29). Midwives see themselves as caregivers for women who experience physiological pregnancy, birth and the puerperium/breastfeeding period. Promotion of normal births and advocacy for women is very challenging for midwives who work in hospitals where a strict hierarchical system and midwives are needed to obey obstetrician’s orders. Midwives are urged to treat more than one woman in a short period of time and limit their goals for caring for women individually and dissatisfaction with the care provided (7).

CONCLUSION AND RECOMMENDATION

Partnership women and Midwives is part of the philosophy of Midwifery. The philosophy of Midwifery care partnerships in providing a positive experience, the lack of a sense of trauma and post-natal depression and an increase in the rate of breast-feeding. Women feel safe when Midwives handle since pregnant are the same person and to know its history. Midwives became “friends” for women in addition to husband / family. Psychologically perceived comfort women can reduce Maternal Mortality Rate (MMR) due to the complications that occur when postpartum.
